

Pondera County Surface Water

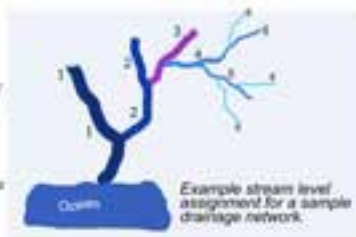

Map 10

Surface water features are from the National Hydrography Dataset (NHD). The NHD is a feature-based dataset that interconnects and uniquely identifies stream segments and surface water.

The stream level is a numeric code that identifies each main path of water flow through a drainage network. The stream level value is incremented by one and is assigned to all transport reaches that terminate at this path.

Spatial data (base maps) were obtained from the Montana Geographic Information Clearinghouse - Montana Natural Resource Information System (NRIS).
